Year : 2020-2021 Rev 03

#### **CHAPTER - 1INTRODUCTION**

Krishna Institute of Medical Sciences "Deemed To Be University", (Herein after referred to be KIMSDU) is located at Karad, Maharashtra. KIMSDU is accredited by NAAC 'A' grade and has been conferred with ISO 9001:2015 certification. The constituent faculties of the University include Medical, Dental, Physiotherapy, Nursing, Pharmacy and Allied Sciences offering undergraduate and postgraduate courses in the respective faculties. It also runs Ph.D. programs and Post-Doctoral Fellowships in various subjects.

The medical college is about 35 years old and is recognized by the Medical Council of India, Medical Council of Malaysia and is listed in the WHO's World Directory of Medical Schools. Medical Council of India recognizes MBBS and postgraduate degree/ diploma courses in clinical and basic sciences in 17 disciplines.

It has state-of-the-art museums with large collection of specimens and models. National Accreditation Board has accredited the KIMS diagnostic laboratory for Testing and Calibration Laboratories (NABL). It's been conferred with ISO 9001:2015 and ISO 14001:2015 certification. The Lead Referral Laboratory is the first of its kind in Maharashtra state, which was ranked the first amongst 40 such centers in India. The well-equipped NABL accredited Department of Molecular Biology and Genetics is a feather in the cap.

National Accreditation Board recognizes the teaching hospital KH&MRC (Krishna Hospital and Medical Research Centre) for Hospitals & Healthcare Providers (NABH).

The teaching hospital is 1125 bedded multispecialty tertiary care hospital with facilities for Critical Care, Endoscopic Surgeries, Dialysis, Cardiology, Cardio-vascular-thoracic-surgery, Oncology, Urology, Neurosurgery, Plastic surgery, Oral and Maxillofacial Surgery and a recognized Renal Transplant Unit. It has fully equipped major operation theaters, minor theaters, labour rooms, blood bank accredited by NABH, radio diagnosis and radiotherapy, computerized medical records, counseling services etc. There are separate intensive care units like Medical, Surgical, Coronary care, Pediatric, Neonatal (accredited by Neonatology Forum of India), Respiratory and Obstetrics. Neonatology Forum of India recognizes the neonatal ICU. The radio-diagnosis department has facilities for MRI, color Doppler, mammography, DSA etc. It also actively participates in national healthcare programs and various extensions and outreach community programs initiated by the institute.

The University has been ranked 5th amongst the cleanest higher Educational Institutions in the category of 'Technical Institutions - Universities (Residential)' in the year 2018. The University has also received certificate for 'Maintaining, Promoting and Encouraging the Culture of Swachhta in Higher Education Institutions in the country'.

#### The institute has also received recognitions as below:

1. Commendation Award (Green Institutional Mentor Award) – Letter dated 08th March 2020

PREPARED BYEASE TECHNOLOGY Page 5 of 34

Project : Water Audit Report

Year : 2020-2021 Rev 03

2. Krishna Hospital and Medical Research Centre was ranked 1st as a Clean Hospital in "Swachh Sarvekshan 2020" among the Hospitals in Malkapur Nagarparishad, Tal. Karad, Dist. Satara - Certificate dated 29th June 2019.

3. Recognized Social Entrepreneurship, Swachhata & Rural Engagement Cell - Certificate dated 30th August 2020.

This report is prepared by Mrs. Pragatee R. Bhosale from EASE Technology Kolhapur. The survey was conducted on 4<sup>th</sup> & 5<sup>th</sup> January 2021. Report submitted to institute on 20<sup>th</sup> January 2021 and finalized after some revisions.

#### BRIEF ABOUT WATER AUDITING

Water auditing is a systematic & scientific examination of water accounts of the projects. It is an intelligent & critical examination by independent organization. It is a critical review of system of accounting.

A water audit determines the amount of water used in different sectors; amount of water lost from distribution system due to leakages. Comprehensive Water Audit can give a detailed profile of distribution system & water users, thereby facilitating easier & effective management of resources and improved reliability. It has proved to be an effective tool for understanding & assessment of performance level of the projects. Water auditing involves checking of sector-wise water use against project planning.

PREPARED BYEASE TECHNOLOGY Page 8 of 34

Project : Water Audit Report

Year : 2020-2021 Rev 03

A water audit is an on-site survey and assessment of water-using hardware, fixtures, equipment, landscaping, and management practices to determine the efficiency of water use and to develop recommendations for improving water-use efficiency. In simple words, a water audit is a systematic review of a site that identifies the quantities and characteristics of all the water uses.

The site may vary from a public water utility, facility (institutional or commercial properties like malls, office, schools etc.) or a household. The overall objective of conducting a water audit is to identify opportunities to make system or building water use more efficient.

Since water uses vary greatly from one type of business or institution to another and from site to site, therefore water audit is crucial to determine quantity, nature and quality of water consumption. Water audit for a water utility refers to tracking, assessing and validating all components of flow from the site of withdrawal or treatment through the water distribution system and into the consumer's properties. On the other hand, water audit of an office building would review direction and quantity of water used for domestic, cooling/heating, sanitary and landscaping processes. Whereas, a domestic water use audit examines the major areas in which a facility uses water, including human consumption, personal hygiene & sanitation, washing, cleaning, laundry, gardening etc.

Thus, even though the nature and scale of water use varies and differs according to the sites and systems, the underline principle is common, that is, water use audit determines where the water ends up and in what amount. The audit exercise provides decision making tools to the concerned people in the utility, institutions or households by identifying inefficient uses, problem areas wherein water conservation and remedial measures can be undertaken.

Water auditing is an ongoing process and rarely stays consistent in a site or system overtime. Therefore, in order to gauge progress from adopted water conservation and cutbacks, water audit should be performed on a regular basis. In addition, it provides convincing overview of the water use trends, effectiveness of conservation measures and potential cost and water savings.

#### **Benefits of Water Audit**

Water audit improves the knowledge and documentation of the distribution system, problem and risk areas and a better understanding of what is happening to the water after it leaves the source point. Leak detection programs help in minimizing leakages and tackling small problems before they become major ones. These programs lead to-

- a. Reduced water losses,
- b. Improved financial performance,
- c. Improved reliability of supply system,
- d. Enhanced knowledge of the distribution system,
- e. Efficient use of existing supplies,
- f. Better safeguard to public health and property,
- g. Improved public relations,
- h. Reduced legal liability, and
- i. Reduced disruption, thereby improving level of service to customers

Project : Water Audit Report

Year : 2020-2021 Rev 03

#### **CHAPTER - 3METHODOLOGY**

The key components in the water audit methodology are as below -

#### 1. Pre-Audit Information

- Preliminary literature review of concepts and methodologies related to water audit for utility, facilities and households.
- Walk through the entire building to understand the nature of water uses and the systems installed in the building.
- Discussion with the administrative officers, housekeeping and kitchen employees on the various water uses during the day and the source of water.
- Regular discussions with the administrative department including the electrician, housekeeping and canteen In charge were conducted throughout the exercise on current situation and the past trends in water consumption, current sources, supply amount, source metering, distribution, storage, wastewater generation etc.

#### 2. Base-lining and benchmarking

The water audit for KIMSDU included both primary and secondary data collection for various identified water uses. Primary data collection included the following components

- Development of questionnaire format for individual water use, mopping, gardening etc.
- Sample survey of KIMSDU staff to estimate individual water consumption on sanitary and drinking purposes based on questionnaire format.
- For other water uses in kitchen, irrigation, mopping etc. primary data on time, patterns and frequency of water use was recorded over a varying period of time.
- Secondary data collection included compilation of average number of visitors visiting KIMSDU, along with their duration of stay.
- Collating records of water pumped to the overhead tanks, average borewell withdrawals etc. to estimate actual supply.

#### 3. Conducting a water audit at the building level

- The data collection and processing for personal water use including drinking, flushing and face/ hand washing, mopping, irrigation, utensil washing etc. was done on the basis of actual consumption.
- One liter bottle and 10 liters bucket method were used to estimate the flow rate from various taps used for a variety of purposes. This was then calculated with the frequency of use to determine the actual water use.
- As part of the survey, staff members recorded the number of daily visits to, flushes in toilets and urinals, along with daily frequency of hand washing and average time of water flow from the taps.
- The data for all the above uses was calculated for varying time period for example personal water use survey was based on a weeklong observation by the KIMSDU staff to calculate per capita use.

#### CHAPTER - 4WATER CONSUMPTION & WATER SOURCES

As a primary data collected by survey, we found

| Sr. No. | Particulars                 | Details   |
|---------|-----------------------------|-----------|
| 1       | Students staying at Hostels | 1583 Nos. |
| 2       | Students at College         | 2298 Nos. |
| 3       | Teaching Staff              | 308 Nos.  |
| 4       | Non-Teaching Staff          | 1952 Nos. |
| 5       | Visitors                    | 2500 Nos. |
|         | Total                       | 8641 Nos. |

Estimation of water requirement for drinking & domestic use as per (Source: NBC 2016, BIS)

| Sr.<br>No. | Particulars                 | Details   | Water Consume<br>limit | Total water in lit/day |
|------------|-----------------------------|-----------|------------------------|------------------------|
| 1          | Students staying at Hostels | 1583 Nos. | 135 lit/day            | 213705.00              |
| 2          | Students at College         | 2298 Nos. | 45 lit/day             | 103410.0               |
| 3          | Teaching Staff              | 308 Nos.  | 45 lit/day             | 13860.00               |
| 4          | Non-Teaching Staff          | 1952Nos.  | 45 lit/day             | 87840.00               |
| 5          | Visitors                    | 2500 Nos. | 15 lit/day             | 37500.00               |
|            | Total                       | 8641 Nos. |                        | 456315.00              |

Total expected Water consumption as per NBC 2016, BIS for KIMSDU is – 456.315 m3/day.

This water requirement is fulfilled by Malkapur Nagar Parishad (M.N.P.), Irrigation (Koyna river water & Ground Water).

#### **Actual Water Uses -**

#### **Summary Water Consumption**

| Sr.<br>No. | Description | Water<br>Consumption<br>(M³/day) | Source/Remark                            |

|            | Total            | 716.00                           | (Fresh Water & Treated Water From STP)   |

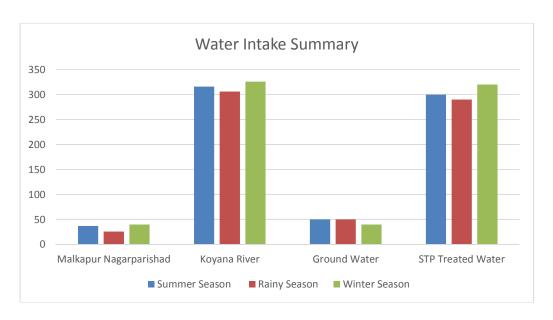

PREPARED BYEASE TECHNOLOGY Page 12 of 34

Project : Water Audit Report

Year : 2020-2021 Rev 03

#### Water Adequacy -

Total fresh water requirement for 365 Days shall be -

$$406 \text{ CMD} \quad X \quad 365 \text{ Days} = 148190 \text{ M}^3/\text{Year}$$

Source of water

Primary Source -

- 1. Koyana river (7,50,000 Lit/Day) Gov. of Maharashtra Sangli path-bandhare vibhag, Sangli.
- 2. Malkapur Nagarparishad 40000 Lit./day
- 3. There are seven submersible pumps of 750 Ipm capacity and Two spare for emergency.

#### Secondary / Alternate Source

4. Bore wells act as an alternate source in the case of supply failure from river water. Presently the bore well water is being used for domestic use.

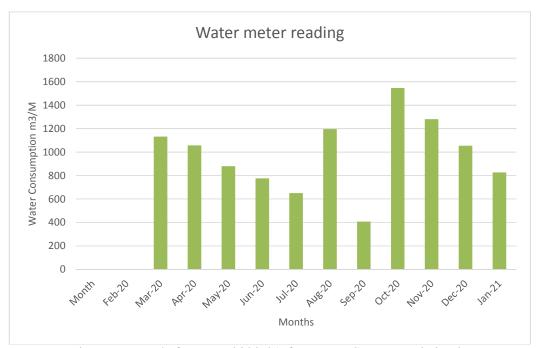

Hence total water requirement is **406.0 m3/day**; which is less than 456.315 m3/day is; water requirement for drinking & domestic use as per (Source: NBC 2016, BIS). Actual Permission granted by irrigation dept. & Nagarparishad is much higher than actual water consumption in KIMSDU.

#### **Water Treatment Plant**

KIMSDU, Karad has its own fully automatic water treatment plant which supplies 24\*7 water for all buildings in the Campus.

KIMSDU have own irrigation water supply scheme from "Koyna River", have taken water lifting permission from "Sangli Patbandhare Vibhag, Sangli, Inward No – 6093 dated 07.09.1991 for water lifting capacity 7.50 lakh liters per day. The lifted water is stored in the storage tank which is then further treated by fully automatic water treatment plant, having capacity 75 m³/hr. The treated water is stored in storage tank which is lifted into overhead water tank for further supply for use.

#### **Testing of water:**

- The water shall be tested for biochemical and microbiological analysis.
- The reports of the same shall be maintained in Civil Maintenance Department.
- Water testing is done by govt approval lab every month.

#### Water treatment plant details

- Water Treatment Plant Capacity 7500000 lit/Day
- Supplied by WTE Infra, Pune
- Installation Year 2016-2017

#### **Sewage Treatment Plant**

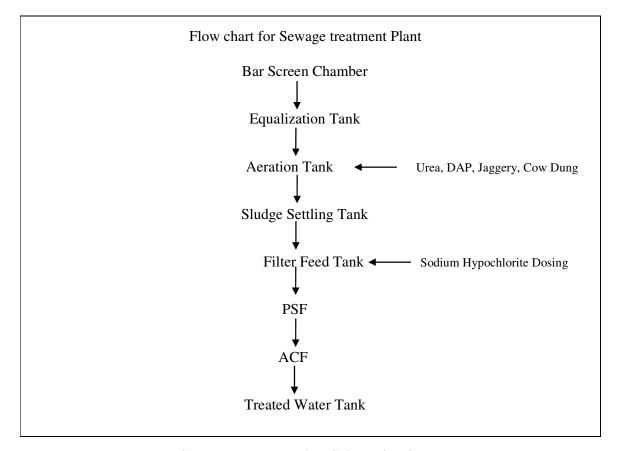

KIMSDU has installed two nos. of Sewage Treatment plants to treat the sewage water which generates in the hospital campus. The capacity of this plant is 500 KLD each. In this plant they have introduces the 'Moving bed bio-reactor (MBBR) technology' to treat the raw sewage water.

#### **Testing of water:**

- The water shall be tested for biochemical and microbiological analysis.
- The reports of the same shall be maintained in Civil Maintenance Department.
- Water testing is done by govt approval lab every month.

#### **Sewage Treatment Plant Details**

- Sewage Treatment Plant Capacity 500000 lit/Day X 2 Nos.
- Supplied by WTE Infra, Pune
- Installation Year Old STP 2014& New STP 2018

#### CHAPTER - 6ACTION PLAN FOR WATER CONSERVATION

#### **Conservation of Ground Water Resources**

Groundwater is an important component of hydrological cycle. It supports the springs in hilly regions and the river flow of all peninsular rivers during the non-monsoon period. For sustainability of ground water resources, it is necessary to arrest the ground water outflows by

- (a) Construction of sub-surface dams
- (b) Watershed management.
- (c) Treatment of upstream areas for development of springs
- (d) Skimming of freshwater outflows in coastal areas and islands.

#### **Rainwater Harvesting**

Rainwater harvesting is the one of way to conserve the water and increase the ground water table. Here the collection and storage of rainwater at the surface or in sub-surface aquifers, before it is lost as surface runoff. Ground water augmentation through diversion of rainfall to sub-surface reservoirs, by various artificial recharge techniques, has special relevance in India where due to terrain conditions most of the rain water is lost as flash floods and local streams remain dry for most part of the year.

The harvesting of rain water simply involves the collection of water from terrace surfaces on which rain falls and subsequently storing this water for increase of bore ground water level. The rain water collected can be stored for direct use or can be recharged into the underground aquifers. In scientific terms water harvesting (broadly) refers to collection and storage of rain water from the roof tops. This also restricts evaporation and seepage into building foundations.

A rain water harvesting system consists of:

- i. Roof catchment
- ii. Rain / Storm water drains
- iii. Down pipes
- iv. Filter chamber
- v. Water collecting n Pits / Sumps
- vi. Terrace water recharge for bore well in the campus.

RWH is a way to capture the rain runoff, store that water above ground or charge the underground aquifers and use it later. This happens naturally in open rural areas. But in congested, over-paved metropolitan cities, there is a need to devise methods to capture the rain water. The rain water that is collected on the surface / roof top is guided to bore wells or pits or new/old/abandoned wells through small diameter pipes to recharge the underground water which can be used later whenever required.

PREPARED BYEASE TECHNOLOGY Page 22 of 34

Project : Water Audit Report

Year : 2020-2021 Rev 03

Some of the benefits of rainwater harvesting are as follows:

i. Increases water availability.

ii. Increase the water table level

iii. Improves the quality of ground water through the dilution of fluoride, nitrate and salinity.

iv. Is environmentally friendly

Rain water can be harvested to the extent of 65,000 liters per 100 sq. m. area per year from roof tops. The capacity of this project to collect and percolate the rain water from the terrace into the ground is 68 lakh lit/year. To increase ground water level for all bore well in the campus.

#### **Rain Water Harvesting System**

Ground water level in the KIMSDU campus is monitored. Details of level is tabulated in following table –

|                  | Water Level Depth |
|------------------|-------------------|
| March - 2020     | 28 ft.            |
| April - 2020     | 30 ft.            |
| May - 2020       | 32 ft.            |
| June - 2020      | 30 ft.            |
| July - 2020      | 29 ft.            |
| August – 2020    | 25 ft.            |
| September - 2020 | 16 ft.            |

Hourly water pumping at bore well is monitored at KIMSDU. Approximately 5 hp pump discharges 200 liter of water per minute i.e. 12000 lit/hr. Details are as below -

|                  | Hours | Discharge Per Day |
|------------------|-------|-------------------|
| March - 2020     | 8     | 96000 lpm         |
| April - 2020     | 6     | 72000 lpm         |
| May - 2020       | 4     | 48000 lpm         |
| June - 2020      | 5     | 60000 lpm         |
| July – 2020      | 7     | 84000 lpm         |
| August – 2020    | 10    | 120000 lpm        |
| September - 2020 | 12    | 144000 lpm        |

#### **Recommendations for Water Conservation**

- 1. Fixing the water meter in all water tank outlet.
- 2. Mend the leaks in taps and pipes.
- 3. Flushing system maintaining & proving dual flash tank for WC.
- 4. Auto flash cock for basin.
- 5. Avoiding use of running water while hand-washing;
- 6. Waste treated water from STP used for flashing system for urinal & WC & also for garden in all campus.
- 7. Water saved from leakage of pipeline.
- 8. Overhead tank auto filling for prevent of water tank over flow or Using over flow stop valve in the overhead tanks to check over flow of water.
- 9. Providing Auto level guard for overhead tank.
- 10. Providing auto flash valves for wc & basin.
- 11. Providing dual flash tank for we & basin.
- 12. Separate arrangement for wc & urinal flashing from STP Treated water
- 13. Regular monitoring tap & pipeline leakage.

Project : Water Audit Report

Year : 2020-2021 Rev 0

14. Rain water can be harvested to the extent of 65,000 liters per 100 sq. m. area per year from roof tops. The capacity of this project to collect and percolate the rain water from the terrace into the ground is 68 lakh lit/year. To increase ground water level for all bore well in the campus.

- 15. Avoiding over watering of lawns.
- 16. Watering of lawn or garden during the coolest part of the day (early morning or late evening hours) when temperature and wind speed are the lowest. This reduces losses from evaporation.
- 17. Setting sprinklers to water the lawn or garden only, not the street or sidewalk
- 18. Avoiding use of excess fertilizers for lawns in view of the fact that application of fertilizer increases the requirement of water in addition to polluting the groundwater.
- 19. Planting of native and/or drought tolerant grasses, ground covers, shrubs and trees. Once established, they do not need to be watered as frequently and they usually survive a dry period without much watering.
